

05.08.2024

$$T(0) = T(1) \leq C$$

↓  
time complexity

$$= O(1), \Theta(1)$$

$$T(n) = T(n-1) + T(n-2) + \Theta(1)$$

Assumption: Addition takes  $\Theta(1)$  time.

$$T(n-1) \geq T(n-2)$$

$$\geq 2T(n-2) + \cancel{\Theta(1)} \begin{matrix} \nearrow C \\ \nearrow C \end{matrix}$$

$$\geq 2[2T(n-4) + \cancel{\Theta(1)}] + \cancel{\Theta(1)} \begin{matrix} \nearrow C \\ \nearrow C \end{matrix}$$

$$= 2^2 T(n-4) + C[2+1]$$

$$\Rightarrow 2^j \cdot T(n-2j) + c[1+2+\dots+j]$$

$$\Rightarrow 2^{n/2} T(1) + \underbrace{c \cdot \Theta(n^2)}_{j \approx n/2}$$

$$\Rightarrow 2^{n/2} \cdot 2^{\Theta(n)}$$

$n=20, 40,$

Hopeless!

Can we do better?

Procedure Ifib( $n$ )

$F \leftarrow$  empty array of size  $n$ .

$F(0) \leftarrow 0$

$F(1) \leftarrow 1$

for  $j = 2$  to  $n-1$

$F(j) = F(j-1) + F(j-2)$ .

Return  $F(n-1)$ .

$$\left( \begin{array}{c} \theta(1) \\ \downarrow \\ \text{fetching} \end{array} + \underbrace{\theta(1)}_{\text{adding}} \right) \theta(n).$$

$$= \theta(n) \leftarrow 10^6, 10^7$$

$$\geq 2^{n/2}.$$

$$\text{Running time} \wedge \text{IFib.} = \theta(n).$$

$$\text{Running time of Fib}(n) \text{ computation. } \underbrace{\theta(n)}_{\downarrow \theta(n)} \quad \underbrace{O(n)}$$

Remark

Assumption. Addition of two  $n$ -bit numbers has complexity  $\Theta(n)$ .

$$\boxed{2^n \gg}$$

$$F(n) = F(n-1) + F(n-2).$$

$$\gg 2^{n/2}.$$

$$n/2 \leq \# \text{ bits} \leq n.$$

$$\sum_{i=0}^n \Theta(i) = \Theta(n^2).$$

## Module 1: Algorithm with numbers

- addition
- subtraction (later)
- multiplication
- gcd.
- modular arithmetic.

Addition |

Carry	1	1	1	0	
	1	0	1	1	A
	1	1	0	1	B

---

1	0	0	0
---	---	---	---

$\oplus \leftarrow \text{XOR}$ , parity: even  $\rightarrow 0$ , odd  $\rightarrow 1$

Procedure Add (A, B)

// A, B are both n-bit numbers.

$C \leftarrow 0$

for  $i = 1$  to  $n$ .

$R[i] \leftarrow A[i] \oplus B[i] \oplus C$

~~C~~  $\downarrow$   
if (at least 2 of  $A[i]$ ,  $B[i]$ ,  $C$  is 1)

$C \leftarrow 1$

else

$C \leftarrow 0$

time complexity

each iteration  $\leftarrow \Theta(1)$   
total time  $\Theta(n)$ .

time complexity of algorithm  $\rightarrow \Theta(n)$ .  
 $\rightarrow \Omega(n)$ .  
 $\Rightarrow \Theta(n)$ .

Increase of bits

If we add two  $n$ -bit numbers,  
how large is the output?

—  $\leq (n+1)$ -bit

$$2^n - 1 + 2^n - 1 =$$

$$\frac{2^{n+1} - 2}{(n+1)\text{-bits.}}$$

$$\begin{array}{r} 1011 \\ 1100 \\ \hline 1111 \end{array}$$

Fact:

If we add two bits, we ~~can~~ get  
~~up~~ a 2 bit number

Fact:

If we add two <sup>base</sup> <sub>$i$</sub>   ~~$b-1$~~  <sup>2, 10, 16</sup> number, we get  
a 2-bit number.

$$(b-1) + (b-1) + (b-1) \left\{ \begin{array}{l} \equiv 3b-3 \\ \equiv b + (2b-3) \\ (1, 2b-3) \end{array} \right.$$

Slight correction -- it should be:  
 $(3b-3) = 2b + (b-3) = (2, b-3)$  in base- $b$   
representation for  $b > 2$ .

For  $b=2$  this is correct.

## Multiplication

If we have two  $n$ -bit numbers, how large will be the result after multiplication. ?

$$- (2^n - 1)(2^n - 1) = \underbrace{2^{2n} - 2^{n+1} + 1}_{2n\text{-bit number.}}$$

## Procedure Multiply (A, B)

// A, B are two  $n$ -bit numbers.

// A[i] ..... A[n] is the array A.

// ~~0~~ 1 indexing is used.

R  $\leftarrow$  empty array of size  $2n$ .

~~for~~ // 1 position of array is lsb.

// B: 1 0 1 1  
      4 3 2 1

for  $j = 1$  to  $n$ .

if ( $B[j] = 0$ )  
 $A \leftarrow \text{leftShift}(A)$   
continue

elif

$R \leftarrow R + A$

$A \leftarrow \text{leftShift}(A)$

↓  
shift left & append a 0.

return  $R$ .

Correctness: obvious

Time complexity:  $\Theta(n) \cdot \Theta(n) = \Theta(n^2)$

Multiplication has true complexity

~~$\Theta(n^2)$~~

$O(n^2)$

You can do better!

Substitution: Skipped.

## Division

Procedure Division  $(x, y)$ .

// divide  $X/Y$ ,  $x, y$  are +ve.

//  $q$  quotient,  $r \leftarrow \text{remainder}$ .

//  $x, y$  are  $n$  bits.  $q, r$ .  
if  $(y = 0)$  raise "error"  
if  $(x = 0)$  return  $(0, 0)$ .

end if

$z \leftarrow$  most  $(n-1)$  significant bits of  $x$

$(q', r') \leftarrow \text{Division}(z, y)$ .

$$q \leftarrow \frac{z \cdot q'}{2} \quad \checkmark$$

$$r \leftarrow \frac{2r'}{2} \quad \checkmark$$

if  $\left( \frac{x[i] = 1}{2} \right)$

if  $(r > y)$

$r \leftarrow r + y$  end if

{  
   $q \leftarrow \lfloor \frac{q+r}{2} \rfloor$  ✓  
   $r \leftarrow \lfloor \frac{q-r}{2} \rfloor$  ✓  
}

end if

return  $\lfloor \frac{q+r}{2} \rfloor$

Conv returns

$$X \leftarrow \underbrace{2Z}_{\text{1}} + \underbrace{0/1}_{\text{b}}$$

$$Z \leftarrow \underbrace{q'y + r'}_{\text{1}} ; q = 2q', r \in Lr'$$

$$r \leftarrow (2r' + b) \bmod y.$$

$$q \leftarrow \begin{matrix} q' + 1 \\ q' \end{matrix}$$

How much time does it take.?

$$T(n) = T(n-1) + \underline{\theta(n)} \quad c.n$$

$$= T(n-2) + cn + c(n-1)$$

$$\vdots$$
$$= T(1) + c[n + (n-1) + \dots + 1]$$

$$= O(1) + \theta(n^2)$$

$$= \theta(n^2).$$

Division has time complexity  $O(n^2)$ .

---

## Modular Arithmetic

$$(x + y) \bmod N$$

remainder of  $(x + y)$  when divided  
by  $N$ .

— cryptographic algorithms

Q:

Compute  $(x+y)$  and  $N$

$x, y, N$  are both  $n$ -bit integers.

—  $\theta(n), \theta(n^2) \rightarrow \theta(n)$  time!

Q:

Compute  $(x \cdot y)$  and  $N$

$\theta(n^2), \theta(n^2) \rightarrow \theta(n^2)$  time!
